of human exposure to radioactive iodine in the 1986 nuclear accident: evaluation of countermeasures. The event of 1986 nuclear accident in Chernobyl was studied as a model of radioactive iodine release from the damaged reactor to estimate the exposure dose after the accident. The dose to the thyroid, the main organ exposed to radioactive iodine, was estimated. The countermeasures under study included increases in thyroid-shielding efficiency and the dietary intake of iodine. The results of the simulations showed that the countermeasures can reduce exposure to radioiodine in the most exposed population. However, in order to achieve complete protection against radiation exposure, the dietary iodine intake should be increased to 200 micrograms/person per day. 1. Field of the Invention The present invention relates to new cyclodextrin derivatives. 2. Description of the Prior Art Cyclodextrins, or cyclic oligosaccharides, are known as naturally occurring compounds which occur in the forming of plants and in the compositions of animals. Besides being used as agents for encapsulation or incorporation of various materials, they have been found to be valuable agents for complexing active ingredients of the pharmaceutically active ingredient class. The basic cyclodextrin molecule is made up of the six glucose units (as shown in FIG. 1), linked by.alpha.-1,4-glycosidic bonds. The natural "cereals" produced by nature are made up of glucans made up of the above mentioned glucose units. The molecules differ in the relative positions of the glycosidic bonds so that there are numerous isomers of these molecules. The cyclic oligosaccharides are considered cyclodextrins when they are composed of six glucose units joined by 1,4-.alpha.-linkages. In addition to the natural products there are also artificial cyclodextrins which are produced by chemical means. It is known that many of the cyclodextrins will complex with various materials, including many enzymes and organic materials. The complexes produced are relatively stable to either changes in conditions, such as temperature, or changes in pH. However, it is also well known that certain materials will form cyclodextrin complexes only in certain environments. It is also known that where one material does form a cyclodextrin complex, another material may not. It is also known that both the cyclodextrin molecules and the materials 595f342e71
